

Experiment no-18

18. Implement a simple FOPC parser for basic logical expressions using python program.

PROGRAM:

```
import re

expression = input("Enter a logical expression: ")

pattern = r'(\w+)\(((.*?)\)'

match = re.match(pattern, expression)

if match:
    predicate = match.group(1)
    arguments = match.group(2).split(',')

    print("Predicate :", predicate)
    print("Arguments :", [arg.strip() for arg in arguments])
else:
    print("Invalid logical expression")-|
```

OUTPUT:

```
*** Enter a logical expression: likes(ram,chocolates)
Predicate : likes
Arguments : ['ram', 'chocolates']
```
