

Experiment no-10

10. Implement transformation-based tagging using a set of transformation rules, apply a simple rule to tag words using python.

PROGRAM:

```
▶ sentence = input("Enter a sentence: ")

words = sentence.split()

print("Word\t\tPOS Tag")
print("-----")

for word in words:
    tag = "NN"

    if word.lower() in ["the", "a", "an"]:
        tag = "DT"
    elif word.endswith("ing"):
        tag = "VBG"
    elif word.endswith("ed"):
        tag = "VBD"
    elif word.endswith("ly"):
        tag = "RB"
    elif word[0].isupper():
        tag = "NNP"

    print(word, "\t\t", tag)
```

OUTPUT:

```
... Enter a sentence: i woke up late in the morning
Word          POS Tag
-----
i             NN
woke          NN
up            NN
late          NN
in            NN
the           DT
morning       VBG
```
