

Experiment no-09

9. Implement a rule-based part-of-speech tagging system using regular expressions using python.

PROGRAM:

```
import re

sentence = input("Enter a sentence: ")

words = sentence.split()

print("Word\t\tPOS Tag")
print("-----")

for word in words:
    if re.search(r'ing$', word):
        tag = "VBG"
    elif re.search(r'ed$', word):
        tag = "VBD"
    elif re.search(r'ly$', word):
        tag = "RB"
    elif re.search(r'(ous|ful|able)$', word):
        tag = "JJ"
    elif re.match(r'[A-Z]', word):
        tag = "NNP"
    else:
        tag = "NN"

    print(word, "\t\t", tag)
```

OUTPUT:

```
... Enter a sentence: i love my parents
Word          POS Tag
-----
i             NN
love          NN
my            NN
parents       NN
```
